

## Early Journal Content on JSTOR, Free to Anyone in the World

This article is one of nearly 500,000 scholarly works digitized and made freely available to everyone in the world by JSTOR.

Known as the Early Journal Content, this set of works include research articles, news, letters, and other writings published in more than 200 of the oldest leading academic journals. The works date from the mid-seventeenth to the early twentieth centuries.

We encourage people to read and share the Early Journal Content openly and to tell others that this resource exists. People may post this content online or redistribute in any way for non-commercial purposes.

JSTOR is a digital library of academic journals, books, and primary source objects. JSTOR helps people discover, use, and build upon a wide range of content through a powerful research and teaching platform, and preserves this content for future generations. JSTOR is part of ITHAKA, a not-for-profit organization that also includes Ithaka S+R and Portico. For more information about JSTOR, please contact support@jstor.org.

The printing of the work in this English edition leaves not a little to be desired. Lines five inches long in type as fine as that used in the body of the pages is none too easy to read, and when it becomes still finer type in the footnotes it offers positive difficulties. E. C. S.

Biology and Its Makers, by WILLIAM A. LOCY, Ph. D., Sc. D. Henry Holt & Co., New York, 1908. pp. 469.

In this work Professor Locy of Northwestern University has given to the educated public an untechnical but scholarly account of the rise and present status of biology and its problems. The book will be welcomed both for its contents and straightforward, thoughtful style by students, clergymen, teachers, medical men, and all interested in the achievements of modern science. At the same time the broad outlook over the whole biological field,—comparative anatomy, embryology, histology, etc., — the comprehensiveness and continuity of the work, its clear statement of problems, its excellent table of contents, index, and bibliography up to date will commend it to the specialist. For those who know a little about biology and wish to know more Professor Locy's volume is positively fascinating. One finds the theory of organic evolution fully and adequately treated, to be sure, but in its right setting as part of the orderly development of a great science. The cell theory, the discovery of protoplasm, the rise of bacteriology, and of the science of fossil life, and recent controversies in reference to germinal continuity and the inheritance of acquired characteristics are all presented in their just relation. The generous amount of biographical material, the portraits and other illustrations, and Professor Locy's appreciation of and almost religious respect for the great leaders of scientific thought are sure to make his book of very great educational significance. This work emphasizes the zoölogical rather than the botanical side of biological science as indeed might be expected by all familiar with the research work of the author.

Northwestern University. W. Libby.

La Mano. Appunti antropometrici et antropologici, del Dott. E. AU-DENINO. Rivista Sperimentale di Freniatria e Medicina legale delle Alienazione mentale, Settembre, 1907. Vol. 33, pp. 416-429.

The author of this article is an assistant of Professor Lombroso at the psychiatrical and neuropathological clinic at Turin, and summarizes a number of previous studies of the hand as well as giving the results of his own investigations. The palmar lines of various simians have been studied by Alix, Andreoli, Morselli, Carrara and others, and certain characteristic longitudinal, and in some species, transverse lines, have been made out. In man, these transverse lines tend normally to become more oblique, but both they and the longitudinal lines appear as atavistic phenomena. Dott. Audenio compared the frequency with which these lines appear in normal man, in cretins, insane patients and epileptics with the following results: In normal man about 21% of the hands examined (87 men and 13 women) showed more or less complete longitudinal lines, the frequency being greater

among women than among men; in cretins these lines were found in 66% of the cases examined (39 in number), usually crossed by transverse and oblique lines so as to form an intricate network, a disposition rarely found in the hands of the insane; in idiots (20) and insane patients (20) longitudinal lines were found in 45% and in born delinquents, moral irresponsibles and epileptics (44) in 52% of the cases. The most frequent longitudinal line is that extending to the base of the middle finger, that extending to the base of the third finger is less frequent, and that extending to the base of the little finger occurs most rarely.

The form and proportion of the different parts of the hand have also been studied and the following have come to be considered simian characteristics, a very short thumb, the middle finger much shorter than the length of the rest of the hand (as in many of the idiots studied by Morselli and Tamburini), the index of the hand in comparison with the stature higher than II-I2, i.e., the height more than II-I2 times the length of the hand. On this point researches have been made by Hovelaque, Hervè, Quetelet, Pruner, Bey, Lombroso and Marro, both upon simians and among different human races. They found the following indices:

Gorilla,	14.5	Chinese,	12.8	Australians,	11.9
Chimpanzee,	18	Berbers,	II.I	Todas,	11.8
Orang,	20.8	Palmese,	10.4	White races,	10 (nearly)
O.		Javanese,	13	Arabs,	11.1
		Hottentots,	11.8	Tapanese,	12.8

In epileptics Féré found an average index of from 11.5-11.7; in normal individuals Marro found it to be 10.6 and in delinquents 10.1-12.9. In regard to the greater length of the second finger as compared with the third there has been much discussion, but without arriving at any definite conclusions.

The author examined the index in all of his subjects, normals, cretins, idiots, insane, epileptics and born delinquents, but found no great difference in the percentages of the various forms, save that a low index was frequent in cretins. The length of the thumb was also investigated, but without marked results, except that the very short thumb occurred with greater frequency in cretins, and the very long thumb among idiots and imbeciles. Other proportions of the fingers were also studied, but without obtaining definite results. The article is illustrated and the illustrations show excellently various simian and human types, making available in very compact form the results of much research.

Rivista Italiana di Neuropatologia, Psichiatria ed Elettroterapia. diretta da G. d' Abundo, Professore Ordinario di Clinica delle malattie Nervose e Mentali nella R. Università di Catania, Vol. I, Fasc. 5, Maggio, 1908. pp. 48.

This new periodical, published monthly, is, as its name indicates, devoted to neuropathology, psychiatry and electrotherapy. The present number contains an article by Prof. F. Del Greco, Director of the Insane Asylum at Como, on "Incomplete Recoveries from Insanity," and calls attention to a class of patients who, having recovered a sufficient degree of stability and normality to be discharged from the asylum, are, nevertheless, not fully competent to cope with the complexities of the ordinary conditions of life, especially in cases where the struggle for existence is likely to press heavily upon them. Such patients, though apparently normal or nearly so under sheltering conditions, may, under an unfavorable environment, become dangerous to themselves and to others. Some of them seem to realize this and do not
